The Independence Property of Model Theory

A Mathematical Rosetta Stone

Instructor: José Iovino

Research assistant: Olivia Aubone

A course connecting pointwise limits, finite patterns, symmetry, dynamics, quantum measurement, and numerical computation.

Prescriptions of values connect families of functions with membership patterns in sets and observations along orbits. The course develops the hypotheses that make these translations precise.

MAT 5973 · For undergraduate and graduate students.

Prerequisites: Topology and comfort with functional analysis (Banach spaces, operator algebras, etc.), or instructor consent.

The main development does not require a previous course in model theory. Optional readings make the logical connections precise.
